

SOLUTION BRIEF · TIDAL TO AUTOMIC CONVERSION

Off Tidal. *On schedule.*

Tidal conversions rarely run long because of the jobs. They run long because of surprises: the calendar nobody wants to touch, or the job someone runs by hand at quarter-end.

Robert Mark Technologies moves Tidal workloads to Broadcom's Automic, self-hosted or SaaS, in planned waves, while Tidal keeps running everything that hasn't moved.

150+

Workload Automation
conversions completed by RMT

90 days

to real jobs running on Automic,
with a dated plan for the rest

100%

feature parity between Automic
self-hosted and SaaS

Conversion count spans Workload Automation schedulers. Environments with many thousands of jobs may take closer to 180 days.

WHAT SOME TIDAL TEAMS TELL US

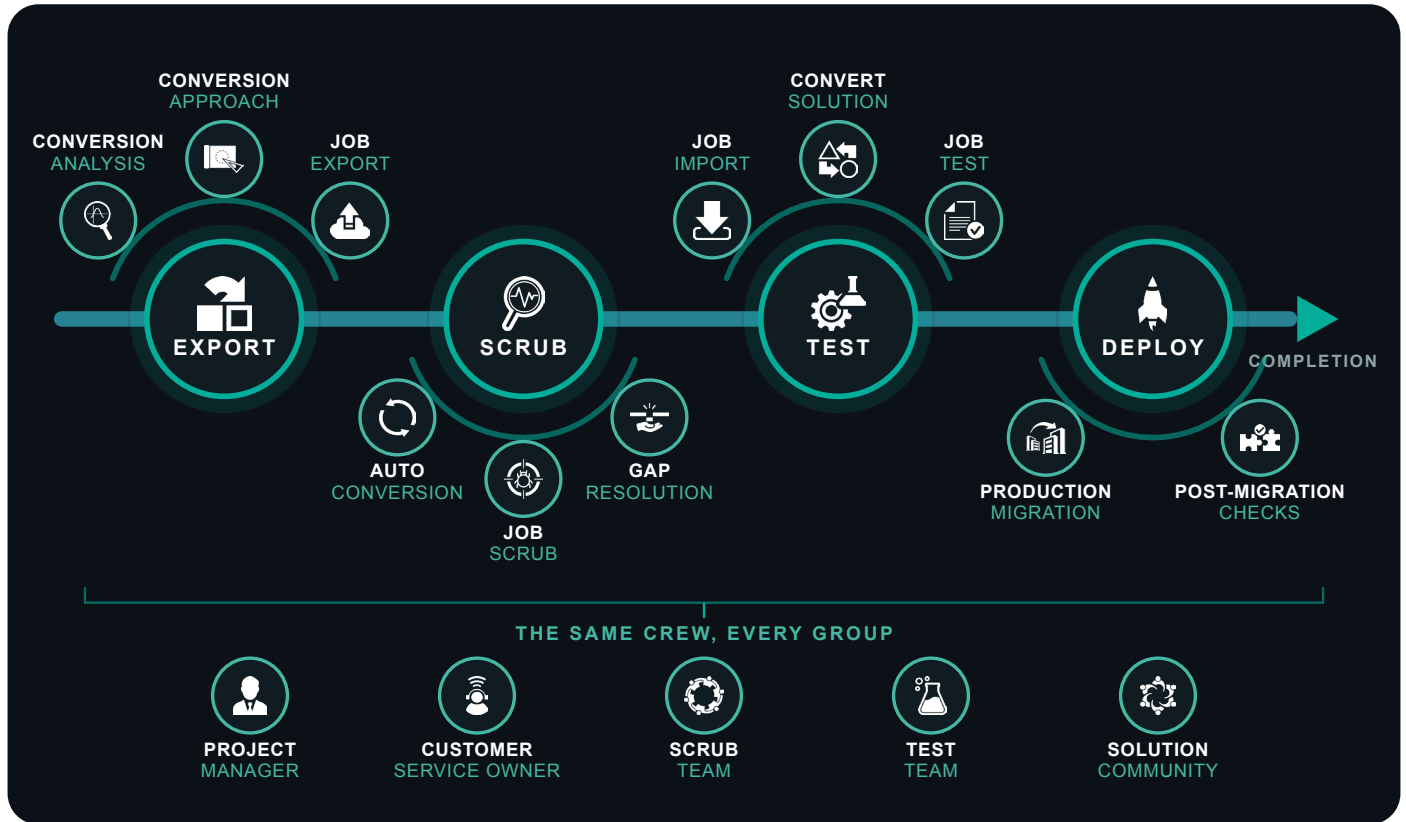

- Support feels less consistent than it used to.
- Renewal costs are climbing, and finance has questions.
- RunMyJobs comes up when it's time to renew.
- The roadmap feels uncertain, and an end-of-maintenance date is on the calendar.

BUILT FOR A LOW-RISK MOVE: RMT HELPS WITH

- Tidal runs everything that hasn't moved yet
- A low-risk pilot group first, then waves
- Automated conversion with job-count checks
- Your programs and scripts stay as they are
- Unit and system testing before cutover
- Support for every wave through final cutover

Four stages, *one conveyor belt*

Every group of jobs rides the same belt: the same stations and the same crew, one group at a time.

The 90-day path

Weeks 1–2: assess and plan. Weeks 3–6: build and validate. Weeks 7–12: go live and optimize, with hypercare after cutover.

ASSESS · BUILD · GO LIVE

Known risks, planned for

Complex calendars, variable inheritance, cross-stream dependencies, file watchers, effective date changes, and app-team time and awareness, the most common reason conversions run long.
